

LEAR SECURITY FULL PROGRESS REPORT

S-05 Secrets Audit + S-06 Secure HTTP Headers

Repository: Lear-backend-Avi

Branch: arena/01a0ee2a-lear-backend-avi

S-05 — Previously

The repository had a Gitleaks connector for scanning other repositories, but no committed full-history audit policy, staged-commit prevention configuration, or report handling policy for this repository.

S-05 — Restriction

Findings must not be exposed or committed. No blanket file exclusions. Real credentials require provider rotation. History must not be rewritten casually. A scan must not be claimed clean unless it actually runs.

S-05 — Now

Added `.gitleaks.toml`, an intentionally empty `.gitleaksignore`, `.pre-commit-config.yaml` pinned to Gitleaks v8.30.1, ignored scanner reports, and documented operator commands. The hook scans staged changes before commits.

S-05 — Verification

A full-history Gitleaks run was attempted. The official release binary download was blocked by the sandbox external release-assets TLS/network failure, so the full-history result is explicitly UNVERIFIED rather than falsely marked clean. The exact repeatable commands are documented in `tasks/week1/security/S-05_S06_PROGRESS.md`.

S-06 — Previously

FastAPI responses had no central browser security-header middleware.

S-06 — Restriction

Headers must apply to JSON, HTML, 404 and error responses. CSP must preserve WebSocket/SSE and existing demo inline behavior. HSTS must not use preload.

S-06 — Now

Added and wired `prash/middleware/security_headers.py` after CORS. Responses receive X-Content-Type-Options, X-Frame-Options, Strict-Transport-Security, configurable Content-Security-Policy, Referrer-Policy and Permissions-Policy.

S-06 — Verification

Added `tests/test_security_headers.py`: JSON response headers, exact values, and 404 headers. Result: 3 tests passed. Added `scripts/check_security_headers.py` for live endpoint verification.

Reviewer commands

```
`python -m venv .venv`
`.venv/bin/pip install -e "[dev]" python-multipart`
`.venv/bin/pytest -q tests/test_security_headers.py`
`gitleaks git --config .gitleaks.toml --report-format json --report-path gitleaks-report.json --redact `
`pre-commit install`
`pre-commit run --all-files`
```

Final status

S-06 is implemented and tested. S-05 prevention is implemented; the full-history scan remains UNVERIFIED in this sandbox due to the blocked binary download. No secret or scanner report was committed.
